

## Lecture 8 - Question 7

A constant energy flux is passing a wire with an homogeneous surface temperature. Due to the voltage drop, heat is being generated at a constant rate  $\dot{\Phi}'''$ . Provide the governing energy balance to determine the heat transfer coefficient.

**Energy balance:**

$$\dot{\Phi} - \dot{Q}_{out} = 0$$

Since the type of heat transfer is steady-state, the sum of the in- and outgoing heat fluxes of the control volume should equal zero.

**Heat fluxes:**

$$\dot{\Phi} = \dot{\Phi}''' \cdot \pi \cdot R^2 \cdot L$$

$$\dot{Q}_{out} = \alpha \cdot 2 \pi \cdot R \cdot L (T_w - T_{\infty})$$
