

Lecture 1 - Question 6

A group of soda cans have a temperature of $T_w = 0\text{ }^{\circ}\text{C}$ and a total surface area of $A = 0.9\text{ m}^2$. These cans are placed in to a room which has a temperature $T_{\infty} = 20\text{ }^{\circ}\text{C}$. The heat transfer coefficient is $\alpha = 20\text{ W/m}^2\text{K}$. Assume steady-state heat transfer. Determine the heat entering the cans.

$$\dot{Q}_{in} = \alpha A (T_w - T_{\infty}) = 20 \cdot 0.9 \cdot -20 = -360\text{ W}$$

So 360 W is entering the cans, since the equation above described the heat loss.
