

Lecture 10 - Question 3

Consider three spheres cooling down. For sphere 1 $Bi \ll 1$, for sphere 2 $Bi \approx 1$ and for sphere 3 $Bi \gg 1$. The center temperature is denoted by $T_{r=0}$ and the surface temperature by $T_{r=R}$ for all the three spheres. Which answer is correct?

The difference between $T_{r=0}$ and $T_{r=R}$ is the smallest for sphere **1** and the biggest for sphere **3**.

For sphere 1 it is known that $Bi \ll 1$, implying that the temperatures inside the body will not vary significantly and thus the difference between $T_{r=0}$ and $T_{r=R}$ is the smallest for this sphere.

For sphere 3 it is known that $Bi \gg 1$, implying that the temperatures inside the body will vary significantly and thus the difference between $T_{r=0}$ and $T_{r=R}$ is the biggest for this sphere.
