

# Tutorial T03 – Elasticity Stress

Answer the following questions as they could come up in an exam.

## 1 Stress basics (geometry)

(Exercise V1 in old material before 2022)

**Given:**

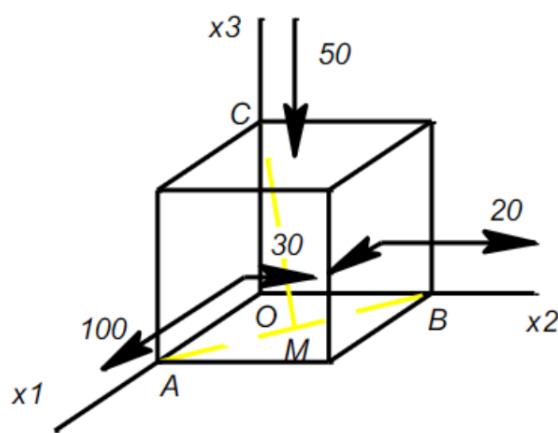

$$E = 200 \text{ GPa}, v = 0.25$$

$$OA = OB = a \text{ and } OC = \frac{1}{2}\sqrt{2} \cdot a$$

In this stress-state, the maximal principal stress must not be larger than: 150 MPa.

**Questions:**

- Find  $\sigma_{ABC}$  and  $\tau_{ABC}$

## 2 Stress and transformation

(Exercise V? in old material before 2022)

**Given:**

$$E = 2 \cdot 10^{11} \text{ Pa}, \nu = 0.25$$

Stress-state in point P:  $\sigma = \begin{bmatrix} 19 & -5 & -\sqrt{6} \\ -5 & 19 & -\sqrt{6} \\ -\sqrt{6} & -\sqrt{6} & 10 \end{bmatrix}$  MPa

**Questions:**

a) Show that the principal stresses are 8, 16 and 24 MPa.

Compute the directional cosines (transformation matrix entries) of the smallest eigen-stress.

### 3 Stress equilibrium

(Exercise V12 in old material before 2022)

In a linear elastic ( $E = 2 \cdot 10^5$  MPa,  $\nu = 0.25$ ) body under load, the stress-field is given (with four free parameters), with respect to the Cartesian  $x_1 - x_2 - x_3$  coordinate system as:

$$\sigma_{11}(x_1, x_2, x_3) = \sigma_0 \left[ 20 + \alpha_1 \left( \frac{x_1}{L} \right) - 10 \left( \frac{x_2}{L} \right) + \alpha_2 \left( \frac{x_1}{L} \right)^2 \right]$$

$$\sigma_{22}(x_1, x_2, x_3) = \sigma_0 \left[ 10 + 8 \left( \frac{x_1}{L} \right) + \beta_1 \left( \frac{x_2}{L} \right) + \beta_2 \left( \frac{x_2}{L} \right)^2 \right]$$

$$\sigma_{12}(x_1, x_2, x_3) = \sigma_0 \left[ 12 - 10 \left( \frac{x_1}{L} \right) + 7 \left( \frac{x_2}{L} \right) - 8 \left( \frac{x_1}{L} \right) \left( \frac{x_2}{L} \right) \right]$$

$$\sigma_{13}(x_1, x_2, x_3) = \sigma_{23}(x_1, x_2, x_3) = \sigma_{33}(x_1, x_2, x_3) = 0$$

with reference stress  $\sigma_0 = 1$  MPa and reference length  $L = 1$  m.

Note that all stresses are independent on  $x_3$  and that the calculation in question (a) below is general with variables  $x_1$ ,  $x_2$ , and  $x_3$ ; from question (b) on, use the point  $P(x_1 = 0, x_2 = 0, x_3 = 0)$ .

#### Questions:

- Does the stress field agree with the stress-equilibrium equations in absence of volume-forces? Which relations have to be valid for the free parameters  $\alpha_1, \alpha_2, \beta_1, \beta_2$  due to stress equilibrium.
  - Compute the eigen-stresses in point P using linear algebra, mathematics -- not the circle of Mohr.
- Describe and name the state of stress in point P (and in all other points in the body).
- Compute the eigen-direction of the major eigen-stress.
