

# Solutions T02 – Elasticity Stress

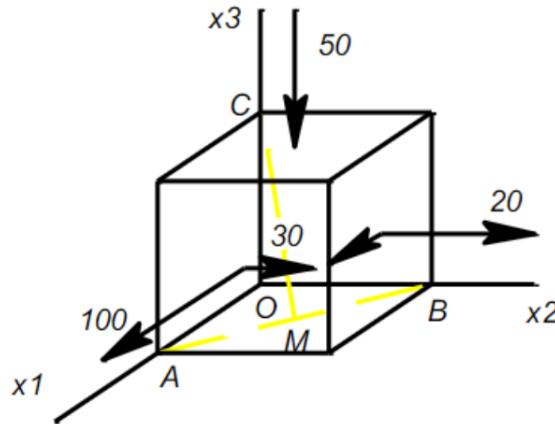

## 1 Stress basics (geometry and stress vector)

... based on section 3.1 (Exercise V1 in old material before 2022)

**Given:**

$$E = 200 \text{ GPa}, \nu = 0.25$$

$$OA = OB = a \text{ and } OC = \frac{1}{2}\sqrt{2} \cdot a$$

In this stress-state, the maximal principal stress must not be larger than: 150 MPa.

**Questions:**

- a) Find normal stress  $\sigma_{ABC}$  and shear stress  $\tau_{ABC}$  acting on the area  $ABC$ .

**Answers:**

a) Stress Tensor is:  $[\sigma_{ij}] = \begin{bmatrix} 100 & 30 & 0 \\ 30 & 20 & 0 \\ 0 & 0 & -50 \end{bmatrix}$  MPa,

given the arrows, using symmetry, direction of arrows (sign), and non-existing (zero).

Find the normal of the plane: this can be done by taking the cross-product of two line vectors (that describe a plane).

$$\vec{AC} \times \vec{AB} = \begin{pmatrix} -a \\ 0 \\ \frac{a}{\sqrt{2}} \end{pmatrix} \times \begin{pmatrix} -a \\ a \\ 0 \end{pmatrix} = \frac{-a^2}{\sqrt{2}} \begin{pmatrix} 1 \\ 1 \\ \sqrt{2} \end{pmatrix} = a \begin{pmatrix} 1 \\ 1 \\ \sqrt{2} \end{pmatrix}$$

Normalizing the vector using the normality condition ( $\hat{n}_1^2 + \hat{n}_2^2 + \hat{n}_3^2 = 1$ ), one can find  $a$ :

$$a^2 (1^2 + 1^2 + \sqrt{2}^2) = 1 \implies a = \frac{1}{2}$$

After using the cross-product, with the vectors in random order we pay close attention to the fact that the normal is facing outside the plane. With the normal you indicate which side the material

is. To make the normal point away from the material, we can choose  $a$  positive.

**Cauchy:** Stress or traction vector:  $p_i = \sigma_{ij}n_j$ , so that:

$$\rightarrow [p] = \begin{bmatrix} p_1 \\ p_2 \\ p_3 \end{bmatrix} = [\sigma] \begin{bmatrix} \hat{n}_1 \\ \hat{n}_2 \\ \hat{n}_3 \end{bmatrix} = \begin{bmatrix} 100 & 30 & 0 \\ 30 & 20 & 0 \\ 0 & 0 & -50 \end{bmatrix} \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 1 \\ -25\sqrt{2} \end{pmatrix} = \begin{bmatrix} 65 \\ 25 \\ -25\sqrt{2} \end{bmatrix}$$

Normal stress on the plane  $ABC$ :  $[\sigma] = [\hat{n}]^T [p] = 20 \text{ MPa}$

Shear stress on the plane  $ABC$ , using Pythagoras:

$$\tau^2 = p^2 - \sigma^2 = [p_1^2 + p_2^2 + p_3^2] - \sigma^2 = 6100 - 400 = 5700 \text{ MPa},$$

so that  $\tau = 75.5 \text{ MPa}$ .

## 2 Stress tensor basics

... based on sections 3.1-3.3. (Exercise V2 in old material before 2022)

**Given:**

- Linear elastic isotropic material with modulus  $E = 2 \cdot 10^5$  N/mm<sup>2</sup>
- The stress cube, below, in units of N/mm<sup>2</sup>
- One principal stress is: 8 N/mm<sup>2</sup>

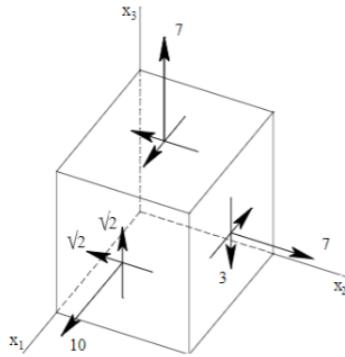

Figure 1: Stress cube → write down the stress matrix

**Questions:**

- Find the other principal (eigen) stresses
- Find the eigen-directions and plot these in a graph.

**Answers:**

- The stress tensor from the cube is:

$$[\sigma_{ij}] = \begin{bmatrix} 10 & -\sqrt{2} & \sqrt{2} \\ -\sqrt{2} & 7 & -3 \\ \sqrt{2} & -3 & 7 \end{bmatrix} \text{ MPa}$$

Note that the first index denotes the direction of the normal to the according surface on which this stress component works, while the second index gives the direction of the stress component.

Next get the characteristic equation from:

$$\det(\sigma_{ij} - \sigma \delta_{ij}) = \begin{bmatrix} 10 - \sigma & -\sqrt{2} & \sqrt{2} \\ -\sqrt{2} & 7 - \sigma & -3 \\ \sqrt{2} & -3 & 7 - \sigma \end{bmatrix}$$

$$\sigma^3 - I_1\sigma^2 + I_2\sigma - I_3 = 0$$

$$I_1 = \sigma_{11} + \sigma_{22} + \sigma_{33} = 24 \text{ MPa}$$

$$I_2 = \sigma_{11}\sigma_{22} + \sigma_{22}\sigma_{33} + \sigma_{33}\sigma_{11} - \sigma_{12}^2 - \sigma_{31}^2 - \sigma_{32}^2 = 176 \text{ MPa}^2$$

$$I_3 = \det(\sigma) = 384 \text{ MPa}^3$$

Here, the characteristic equation is not easily solvable; one way is to use the given eigen-value,  $\sigma = 8 \text{ N/mm}^2$ , and polynomial division (units dropped for simplicity, but must be added for final answer). Take the characteristic equation and divide by  $(\sigma - 8)$ :

$$(\sigma^3 - 24\sigma^2 + 176\sigma - 384) \setminus (\sigma - 8) = \sigma^2 - 16\sigma + 48$$

$$\underline{(\sigma^3 - 8\sigma^2)}$$

$$- 16\sigma^2 + 176\sigma - 384$$

$$\underline{(-16\sigma^2 + 128\sigma)}$$

$$+ 48\sigma - 384$$

$$\underline{( + 48\sigma - 384)}$$

%

The result is a second order polynomial, which can be solved as:

$$\sigma_{1,2} = (16 \pm \sqrt{16^2 - 4 \times 48})/2 = 12 \text{ and } 4 \text{ MPa.}$$

Therefore, the sorted eigen-values are:  $\sigma_I = 12 \text{ MPa}$ ,  $\sigma_{II} = 8 \text{ MPa}$ ,  $\sigma_{III} = 4 \text{ MPa}$ .

b) Direction of  $\sigma_I = 12 \text{ MPa}$

*Insert values, solve the system of equations, and normalize the solution.*

$$\begin{bmatrix} \sigma_{11} - \sigma_I & \sigma_{12} & \sigma_{13} \\ \sigma_{12} & \sigma_{22} - \sigma_I & \sigma_{23} \\ \sigma_{13} & \sigma_{23} & \sigma_{33} - \sigma_I \end{bmatrix} \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{and} \quad n_1^2 + n_2^2 + n_3^2 = 1$$

$\implies$

$$-2n_1 - \sqrt{2}n_2 + \sqrt{2}n_3 = 0$$

$$-\sqrt{2}n_1 - 5n_2 - 3n_3 = 0$$

$$\sqrt{2}n_1 - 3n_2 - 5n_3 = 0$$

The eigen-direction associated to the first, largest eigen-value:

$$\implies \hat{n}^{(I)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \frac{1}{2} \begin{bmatrix} \sqrt{2} \\ -1 \\ 1 \end{bmatrix}$$

Direction of  $\sigma_{II} = 8 \text{ MPa}$

$$\begin{bmatrix} \sigma_{11} - \sigma_{II} & \sigma_{12} & \sigma_{13} \\ \sigma_{12} & \sigma_{22} - \sigma_{II} & \sigma_{23} \\ \sigma_{13} & \sigma_{23} & \sigma_{33} - \sigma_{II} \end{bmatrix} \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{and} \quad n_1^2 + n_2^2 + n_3^2 = 1$$

$\implies$

$$2n_1 - \sqrt{2}n_2 + \sqrt{2}n_3 = 0$$

$$-\sqrt{2}n_1 - n_2 - 3n_3 = 0$$

$$\sqrt{2}n_1 - 3n_2 - n_3 = 0$$

The eigen-direction associated to the first, largest eigen-value:

$$\implies \hat{n}^{(II)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \frac{1}{2} \begin{bmatrix} \sqrt{2} \\ 1 \\ -1 \end{bmatrix}$$

Direction of  $\sigma_{III} = 4\text{MPa}$

$$\begin{bmatrix} \sigma_{11} - \sigma_{III} & \sigma_{12} & \sigma_{13} \\ \sigma_{12} & \sigma_{22} - \sigma_{III} & \sigma_{23} \\ \sigma_{13} & \sigma_{23} & \sigma_{33} - \sigma_{III} \end{bmatrix} \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{and} \quad n_1^2 + n_2^2 + n_3^2 = 1$$

$\implies$

$$6n_1 - \sqrt{2}n_2 + \sqrt{2}n_3 = 0$$

$$-\sqrt{2}n_1 + 3n_2 - 3n_3 = 0$$

$$\sqrt{2}n_1 - 3n_2 + 3n_3 = 0$$

$$\implies \hat{n}^{(III)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \frac{\sqrt{2}}{2} \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

The directions are unspecified, indicated by the plus-minus from taking a square-root; all three direction vectors are normalized (check it, if enough time in exam),  $(n_i)^2 = 1$ ; furthermore, all three normal (eigen) vectors must be pair-wise perpendicular on each other, i.e.  $n_i^{(a)} n_i^{(b)} = 0$ , for all  $a, b = I, II, III$  with  $a \neq b$ .

### 3 Stress tensor basics

... based on sections 3.1-3.3. (Exercise V3 in old material before 2022)

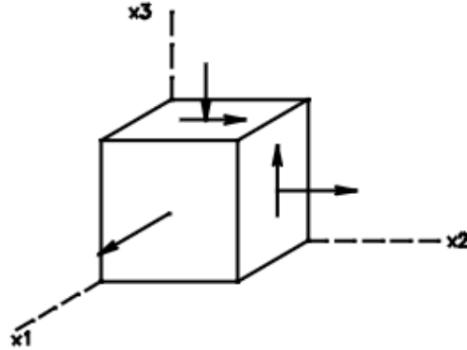

Figure 2: Stress cube, empty → fill it

**Given:**

The stress-state is described by the matrix:  $\begin{bmatrix} 60 & 0 & 0 \\ 0 & 20 & 20\sqrt{3} \\ 0 & 20\sqrt{3} & -20 \end{bmatrix}$  N/mm<sup>2</sup>,  
with  $E = 2 \cdot 10^5$  N/mm<sup>2</sup>, and  $\nu = 0.25$ .

**Questions:**

- a) Compute the principal stresses
- b) Compute the eigen-directions
- c) Compute the maximal shear-stress

**Answers:**

a) The sorted eigen-values are:  $\sigma_I = 60$  MPa,  $\sigma_{II} = 40$  MPa,  $\sigma_{III} = -40$  MPa.

b) Without calculation necessary:

$$\hat{n}^{(I)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

The other eigen-directions are:

$$\hat{n}^{(II)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \frac{1}{2} \begin{bmatrix} 0 \\ \sqrt{3} \\ 1 \end{bmatrix}$$

$$\hat{n}^{(III)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \begin{bmatrix} 0 \\ 1 \\ -\sqrt{3} \end{bmatrix}$$

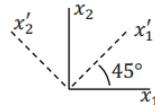

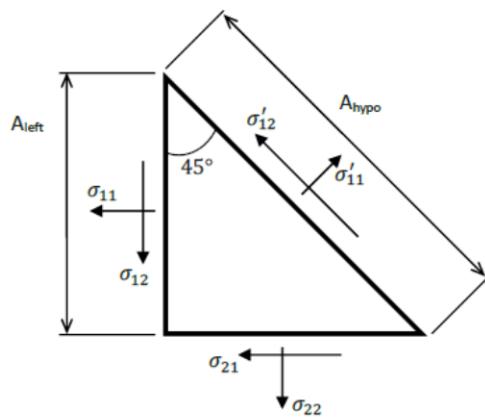

c) The maximum shear stress is:  $\tau_{max} = (\sigma_I - \sigma_{III})/2 = 50$  MPa.

## 4 Stress tensor and transformation

... based on sections 3.1-3.4. (Exercise V10 in old material before 2022)

**Given:**

- A plane-stress state in a point P of a body with  $\sigma_{13} = \sigma_{23} = \sigma_{33} = 0$
- Given are these (mixed) stress components:  
 $\sigma_{11} = 92 \text{ MPa}$   
 $\sigma'_{11} = 194 \text{ MPa}$   
 $\sigma'_{12} = -42 \text{ MPa}$   
where the prime indicates the new (transformed) coordinate system.
- The material is linear elastic with  $E = 2 \cdot 10^5 \text{ MPa}$  and  $\nu = 0.25$ .

**Questions:**

- Give the stress tensor in the original  $x_1x_2x_3$  system.
- Give the stress tensor in the new  $x'_1x'_2x'_3$  coordinate system, as obtained by a rotation of the coordinates about 45° around the  $x_3$ -axis, as sketched above.
- Compute the eigen-stresses and the eigen-directions.

**Answers:**

a)

There are two ways to solve this problem. The triangle given represents all stresses on all sides, but only part of the stress components are known. By considering force equilibrium and using the respective stress components, divided by the side-lengths of the triangle (which also has a third dimension outside the plane, not shown). Assume the sides have unit-length, then the hypotenuse has, according to Pythagoras, length  $\sqrt{2}$ . Further assume the thickness also to be unit-length. The ratio between sides and hypotenuse is then:

$$\frac{A_l}{A_h} := \frac{A_{left}}{A_{hypo}} = \frac{1}{\sqrt{2}} = \frac{1}{2}\sqrt{2}$$

With this we get:

Force balance in  $x_1$  direction:

$$\begin{aligned}
 A_h\sigma'_{11}\cos(45^\circ) - A_h\sigma'_{12}\sin(45^\circ) - A_l\sigma_{11} - A_l\sigma_{12} &= 0 \\
 \Rightarrow \sigma'_{11}\cos(45^\circ) - \sigma'_{12}\sin(45^\circ) - \frac{A_l}{A_h}(\sigma_{11} + \sigma_{12}) &= 0 \\
 \Rightarrow (\sigma'_{11} - \sigma'_{12})\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}(\sigma_{11} + \sigma_{12}) &= 0 \\
 \Rightarrow \sigma_{12} \equiv \sigma_{21} &= \sigma'_{11} - \sigma'_{12} - \sigma_{11} \\
 \Rightarrow \sigma_{12} \equiv \sigma_{21} &= 194 - (-42) - 92 = 144 \text{ MPa}.
 \end{aligned}$$

Force balance in  $x_2$  direction:

$$\begin{aligned}
 A_h\sigma'_{11}\sin(45^\circ) + A_h\sigma'_{12}\cos(45^\circ) - A_l\sigma_{12} - A_l\sigma_{22} &= 0 \\
 \Rightarrow \sigma'_{11}\sin(45^\circ) + \sigma'_{12}\cos(45^\circ) - \frac{A_l}{A_h}(\sigma_{12} + \sigma_{22}) &= 0 \\
 \Rightarrow (\sigma'_{11} + \sigma'_{12})\frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{2}(\sigma_{12} + \sigma_{22}) &= 0 \\
 \Rightarrow \sigma_{22} \equiv \sigma_{21} &= \sigma'_{11} + \sigma'_{12} - \sigma_{12} \\
 \Rightarrow \sigma_{22} &= 194 + (-42) - 144 = 8 \text{ MPa}.
 \end{aligned}$$

The stress tensor in the  $x_1x_2x_3$  system is thus:

$$[\sigma_{ij}] = \begin{bmatrix} 92 & 144 & 0 \\ 144 & 8 & 0 \\ 0 & 0 & 0 \end{bmatrix} \text{ MPa}$$

b)

The stress tensor in the  $x'_1x'_2x'_3$  system is obtained by rotation of the original system around  $45^\circ$ , as sketched, in index notation,  $\sigma'_{pq} = R_{pi}R_{qj}\sigma_{ij}$ , or:

$$[\sigma'] = [R] [\sigma] [R^T] = \begin{bmatrix} 194 & -42 & 0 \\ -42 & -94 & 0 \\ 0 & 0 & 0 \end{bmatrix} \text{ MPa},$$

using the transformation matrix:

$$[R] = \begin{bmatrix} \sqrt{2}/2 & \sqrt{2}/2 & 0 \\ -\sqrt{2}/2 & \sqrt{2}/2 & 0 \\ 0 & 0 & 1 \end{bmatrix}.$$

The *alternative* way is to use the symbolic transformation rule and solve the system of equations, for each component, for the unknowns  $\sigma_{12}$ ,  $\sigma_{22}$ , and  $\sigma'_{22}$ .

c)

The principal stresses and eigen-directions can now be computed the usual way from

$$\det(\sigma_{ij} - \sigma\delta_{ij}) = 0,$$

and  $(\sigma_{ij} - \sigma\delta_{ij})n_j = 0$ , with normalization  $n_j^2 = 1$ .

This stress tensor describes a plane-stress state and thus has one eigenvalue  $\sigma = 0$ .  
The remaining characteristic equation is:

$$\sigma^2 - 100\sigma + 736 - 144^2 = 0$$

with solutions:  $\sigma_{1,2} = (100 \pm \sqrt{100^2 - 4(736 - 144^2)})/2 = (100 \pm \sqrt{9.10^4})/2 = 50 \pm 150$  MPa.

The sorted eigen-values are thus:  $\sigma_I = 200$  MPa,  $\sigma_{II} = 0$  MPa,  $\sigma_{III} = -100$  MPa.

The eigen-directions are:

$$\hat{n}^{(I)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \begin{bmatrix} 0.8 \\ 0.6 \\ 0 \end{bmatrix}$$

$$\hat{n}^{(III)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \begin{bmatrix} 0.6 \\ -0.8 \\ 0 \end{bmatrix}$$

and without calculation necessary:

$$\hat{n}^{(II)} = \begin{bmatrix} n_1 \\ n_2 \\ n_3 \end{bmatrix} = \pm \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$$
