

# Heat Conduction: Task 48

The images describes three rectangular walls, the first and the third wall have the same length. Temperatures in the left and the right are the same. Consider that there is a heat source in the middle and heat conductivity differences.

- 1 Heat flows from the center to the right and left side so the temperature gradient on the left side is decreasing from right to left.
- 2 According to Fourier's law. At constant area and heat conductivity the temperature gradient decreases linearly from right to left.
- 3  $\lambda_2$  is smaller than  $\lambda_1$  which means the temperature gradient in 2 is steeper than in 1.
- 4 The heat flows to the right and to the left so there must be a temperature maximum in area 2 and since the thermal resistance in area 3 is smaller than in area 1 ( $\lambda_3$  larger than  $\lambda_1$ ) , the temperature gradient to the right is steeper than to the left.
- 5  $\lambda_2$  is smaller than  $\lambda_3$  which means the Temperature gradient in 2 is steeper than in 3.
- 6 According to Fourier's law. At constant area and heat conductivity the temperature gradient decreases linearly from left to right.
